PP 33: Change of variables in double integrals, Polar coordinates

- 1. Consider the transformation $T:[0,2\pi]\times[0,1]\to\mathbb{R}^2$ given by $T(u,v)=(2v\cos u,v\sin u)$.
 - (a) For a fixed $v_0 \in [0, 1]$, describe the set $\{T(u, v_0) : u \in [0, 2\pi]\}$.
 - (b) Describe the set $\{T(u,v): (u,v) \in [0,2\pi] \times [0,1]\}$.
- 2. Let R be the region in \mathbb{R}^2 bounded by the straight lines y = x, y = 3x and x + y = 4. Consider the transformation $T: \mathbb{R}^2 \to \mathbb{R}^2$ defined by T(u,v) = (u-v,u+v). Find the set $S \subset \mathbb{R}^2$ satisfying T(S) = R.

- 3. Let R be the region in \mathbb{R}^2 bounded by the curve defined in the polar co-ordinates r=1 $\cos \theta, 0 \le \theta \le \pi$ and the x-axis. Consider the transformation $T: [0,\pi] \times [0,1] \to \mathbb{R}^2$ defined by $T(r,\theta) = (r\cos\theta, r\sin\theta)$. Let S be the subset of $[0,\pi] \times [0,1]$ satisfying T(S) = R. Sketch the regions S and R.
- 4. Using the change of variables u = x + y and v = x y, show that $\int_{0}^{1} \int_{0}^{x} (x y) dy dx =$ $\int_{0}^{1} \int_{v}^{2-v} \frac{v}{2} du dv.$
- 5. Let R be the region bounded by x = 0, x = 1, y = x and y = x + 1. Show that $\iint_R \frac{dxdy}{\sqrt{xy x^2}} = \int_R \frac{dxdy}{\sqrt{xy$ $\left(\int_{0}^{1} \frac{du}{\sqrt{u}}\right)\left(\int_{0}^{1} \frac{dv}{\sqrt{v}}\right).$
- 6. Show that $\int_{0}^{1} \int_{0}^{1-x} e^{\frac{x-y}{x+y}} dx dy = \frac{1}{2} \int_{0}^{1} \int_{-v}^{v} e^{\frac{u}{v}} du dv = \frac{1}{2} \sinh(1)$
- 6. Show that $\int_{0}^{\infty} \int_{0}^{\infty} e^{-x} dx = 0$ Find the region R in \mathbb{R}^{2} satisfying $\int_{\frac{1}{\sqrt{2}}}^{1} \int_{\sqrt{1-x^{2}}}^{x} xydydx + \int_{1}^{\infty} \int_{0}^{x} xydydx + \int_{1}^{2} \int_{0}^{\sqrt{4-x^{2}}} xydydx = 0$ $\iint_{R} xydxdy. \text{ Evaluate } \iint_{R} xydxdy.$ Find the region R in \mathbb{R}^{2} satisfying $\int_{\frac{1}{\sqrt{2}}}^{1} \int_{\sqrt{1-x^{2}}}^{x} xydydx + \int_{1}^{2} \int_{0}^{x} xydydx + \int_{0}^{2} \int_{0}^{x} xydydx = 0$ $\iint_{R} xydxdy. \text{ Evaluate } \iint_{R} xydxdy.$ Atlest one office integral briller

- 9. Evaluate
 - (a) $\int_{0}^{1} \int_{0}^{1-y} \sqrt{x+y}(y-2x)^2 dx dy$.
 - (b) $\int_{2}^{\frac{1}{\sqrt{2}}} \sqrt{1-y^2} (x+y) dx dy$.
 - (c) $\int_{1}^{2} \int_{0}^{y} \frac{1}{(x^2+y^2)^{\frac{3}{2}}} dx dy$.
 - (d) $\int_{0}^{2} \int_{0}^{\sqrt{2x-x^2}} \sqrt{x^2+y^2} dy dx$.

11. Find the volume of the solid bounded by the surfaces $z = 3(x^2 + y^2)$ and $z = 4 - (x^2 + y^2)$.

12. Find the volume of the solid in the first octant bounded below by the surface $z = \sqrt{x^2 + y^2}$ and above by $x^2 + y^2 + z^2 = 8$ as well as the planes y = 0 and y = x.

Practice Problems 33: Hints/Solutions

- 1. (a) If $x = 2v_0 \cos u$ and $y = v_0 \sin u$ then $\frac{x^2}{4} + \frac{y^2}{1} = v_0^2$. The set $\{T(u, v_0) : u \in [0, 2\pi]\}$ is an ellipse.
 - (b) The set is the region enclosed by the ellipse $\frac{x^2}{4} + \frac{y^2}{1} = 1$.
- 2. If x = u v and y = u + v then $y = x \Rightarrow v = 0$, $y = 3x \Rightarrow v = \frac{u}{2}$ and $x + y = 4 \Rightarrow u = 2$. The region S is bounded by the lines v = 0, $v = \frac{u}{2}$ and u = 2 in the uv-plane. See Figure 1.
- 3. See Figure 2.
- 4. Note that $\int_{0}^{1} \int_{0}^{x} (x-y) dy dx = \iint_{R} (y-x) dx dy$ where R is the region in xy-plane bounded by the lines y = x, x = 1 and y = 0. Since $x = \frac{1}{2}(u+v)$ and $y = \frac{1}{2}(u-v)$, $y = 0 \Rightarrow u = v$, $x = 1 \Rightarrow u+v=2$ and $x = y \Rightarrow v = 0$. Therefore $\iint_{R} (y-x) dx dy = \iint_{S} v \frac{\partial(x,y)}{\partial(u,v)} du dv$ where S is the region in the uv-plane bounded by the lines u = v, v + v = 2 and v = 0.
- 5. Take u=x and v=y-x. Then $y=x\Rightarrow v=0$ and $y=x+1\Rightarrow v=1$. Therefore $\iint\limits_R \frac{dxdy}{\sqrt{xy-x^2}} = \iint\limits_S \frac{1}{\sqrt{uv}} \frac{\partial(x,y)}{\partial(u,v)} dudv \text{ where } S \text{ is the region in the } uv\text{-plane bounded by the lines } u=0,\ u=1,\ v=0 \text{ and } v=1.$
- 6. Consider u=x-y and v=x+y. Then $\int\limits_0^1\int\limits_0^{1-x}e^{\frac{x-y}{x+y}}dxdy=\int\limits_S^1e^{\frac{u}{v}}\frac{\partial(x,y)}{\partial(u,v)}dudv$ where S is the region in the uv-plane bounded by the lines u=-v, u=v and v=1.
- 7. See Figure 3. By polar coordinates, $\iint_D xy dx dy = \int_0^{\frac{\pi}{4}} \int_1^2 r^3 \cos \theta \sin \theta dr d\theta = \frac{15}{4} \int_0^{\frac{\pi}{4}} \sin \theta \cos \theta d\theta$.
- 8. The integral becomes $\iint_D dxdy$ where D is the region in the first quadrant in \mathbb{R}^2 bounded by the line y=x and the curve $y=x^2$. The equation $y=x^2$ can be converted in polar as $r\sin\theta=r^2\cos^2\theta$ which implies $r=\tan\theta\sec\theta$. Therefore $\iint_D dxdy=\int_0^{\frac{\pi}{4}\sec\theta\tan\theta} rdrd\theta$.
- 9. (a) Note that $\int_{0}^{1} \int_{0}^{1-y} \sqrt{x+y}(y-2x)^2 dxdy = \iint_{R} \sqrt{x+y}(y-2x)^2 dxdy$ where R is the region bounded by the lines x=0,y=0 and x+y=1. Consider u=x+y and v=y-2x. Then $x=0 \Rightarrow v=u, \ y=0 \Rightarrow v=-2u$ and $x+y=1 \Rightarrow u=1$. Therefore $\iint_{R} \sqrt{x+y}(y-2x)^2 dxdy = \int_{0}^{1} \int_{-2u}^{u} \sqrt{u}v^2 \frac{1}{3} dvdu.$
 - (b) The given integral becomes $\iint_R (x+y) dx dy$ where R is the region bounded by the lines y=0, y=x and the circle $x^2+y^2=1$. By polar coordinates $\iint_R (x+y) dx dy=\int\limits_0^{\frac{\pi}{4}} \int\limits_0^1 (r\cos\theta+r\sin\theta) r dr d\theta$.

- (c) See Figure 4. The given integral becomes $\int_{0}^{\frac{\pi}{4}} \int_{\sec \theta}^{2\sec \theta} \frac{1}{r^3} r dr d\theta$.
- (d) See Figure 5. The given integral becomes $\iint_R \sqrt{x^2+y^2} dx dy$ where R is the region in the first quadrant bounded by the circle $(x-1)^2+y^2=1$ and the x-axis. The points on the circle $y^2=2x-x^2$ is represented by $r=2\cos\theta$ in polar coordinates. Therefore the integral is given by $\int\limits_0^{\frac{\pi}{2}}\int\limits_0^{2\cos\theta}rrdrd\theta$.
- 10. Take $x = \frac{r}{3}\cos\theta$ and $y = \frac{r}{2}\sin\theta$. Then $\frac{\partial(x,y)}{\partial(r,\theta)} = \frac{r}{6}$. Therefore $\iint_R \cos(9x^2 + 4y^2) dx dy = \int_0^{2\pi} \int_0^1 \cos(r^2) \frac{r}{6} dr d\theta = \int_0^{2\pi} \int_0^1 \cos u \frac{du}{12} d\theta$.
- 11. The intersection of the surfaces is the set $\{(x,y,3): x^2+y^2=1\}$. Therefore the volume is given by $\iint_R (4-x^2-y^2-3(x^2+y^2))dxdy$ where R is the region in \mathbb{R}^2 enclosed by the circle $x^2+y^2=1$. By polar coordinate the integral becomes $\int\limits_0^{2\pi}\int\limits_0^1 (4-4r^2)rdrd\theta$.
- 12. The given solid lies above the region R where R is in the first quadrant in \mathbb{R}^2 bounded by the circle $x^2+y^2=4$ and the lines y=x and y=0. Therefore the required volume is given by $\iint_R (\sqrt{8-x^2-y^2}-\sqrt{x^2+y^2}) dx dy = \int_0^{\frac{\pi}{4}} \int_0^2 (\sqrt{8-r^2}-r) r dr d\theta.$
